1. Introduction

The Irvine Company is proposing to demolish the existing 342 multi-family residential units and redevelop the project site with 942 multi-family units in a six building residential apartment community. The buildings would range in height from six to seven stories. The site is located at 19500 Pruneridge Avenue in Cupertino, Santa Clara County, California. This report presents the results of a construction and operational health risk assessment for the proposed project.

The latest version of the Bay Area Air Quality Management District (BAAQMD) CEQA Air Quality Guidelines requires projects to evaluate the impacts of construction activities on sensitive receptors (BAAQMD, 2012). Project construction is anticipated to take place starting in middle of July 2017 and be completed by the end of September 2020, approximately 1,174 calendar days (838 workdays).

The nearest off-site sensitive receptors are the multi-family residences at the Arioso Apartment complex approximately 410 feet west of the project site. The BAAQMD has developed *Screening Tables for Air Toxics Evaluation During Construction* (2010) that evaluate construction-related health risks associated with residential, commercial, and industrial projects. According to the screening tables, the residences are closer than the distance of 137 meters (450 feet) that would screen out potential health risks and could be potentially impacted from the proposed construction activities. Therefore, a site-specific construction health risk assessment (HRA) was prepared for the proposed project.

In addition to project construction, operation of the proposed project would place sensitive receptors in proximity to nearby sources of toxic air contaminants (TACs) and fine particulate matter ($PM_{2.5}$) emissions. Guidance from the California Environmental Protection Agency (Cal/EPA), Office of Environmental Health Hazard Assessment (OEHHA), California Air Pollution Control Officers Association (CAPCOA), and the Bay Area Air Quality Management District (BAAQMD) recommend the completion of health risk assessments to determine the impacts of hazardous air emissions upon land use projects that place receptors in the vicinity of existing sources. Evaluated emission sources include vehicles and trucks traveling on the Interstate 280 (I-280) freeway, which is 360 feet southwest of the proposed site. In addition to I-280, other high volume roadways with annual average daily traffic volumes exceeding 10,000 vehicles per day were evaluated. Identified high volume roadways within 1,000 feet of the project include Wolfe Road and Pruneridge Avenue. Lastly, stationary sources located at the future Apple Campus 2 to the east were included in the evaluation.

This HRA considers the health impact to off-site sensitive receptors (adults and children in the nearby residences) of construction emissions at the project site from diesel equipment exhaust (diesel particulate matter or DPM) and $PM_{2.5}$. Additionally, the HRA also evaluates the health impacts to on-site receptors from the vehicular emissions along I-280, high volume roadways, and stationary sources proximate to the project site.

1. Introduction

This page intentionally left blank.

2. Project Description

The 12.4 acre project site is currently situated with 342 existing multi-family units housed within 10 separate buildings. The site is bound by Pruneridge Avenue to the north, the Apple Campus 2 site to the east, the I-280 exit ramp to the south, and Wolfe Road to the west. Surrounding sensitive land uses include the Arioso Apartments and other multi-family residences to the west as well as single-family housing further to the west.

The proposed project would demolish and remove the existing residential development and would redevelop the site with 942 new multi-family residential units. The units will be contained within six buildings ranging from six- to seven-stories. The buildings within 50 feet of Wolfe Road, Pruneridge Avenue, and the Apple Campus 2 will maintain a maximum building of 60 feet. I-280 is approximately 360 feet southwest of the project site.

The project site and vicinity are depicted in Figure 1.

2. Project Description

This page intentionally left blank.

3. Methodology and Significance Thresholds

The purpose of the HRA is to evaluate the potential health impacts from DPM and $PM_{2.5}$ emitted during construction activities, as well as DPM, Total Organic Gases (TOG), and $PM_{2.5}$ emitted from nearby mobile and stationary sources during occupancy of the units (operational phase). Construction sources evaluated in this HRA include off-road construction equipment, such as excavators, tractors/loaders/backhoes, cranes, forklifts, generators, welders, and air compressors. Operational sources include vehicular emissions from cars and trucks traveling along I-280, Wolfe Road, and Pruneridge Avenue, and stationary sources operating at the proposed Apple Campus 2.

In June 2010, the BAAQMD's Board of Directors adopted CEQA thresholds of significance and an update of the CEQA Guidelines. In May 2011, the updated BAAQMD CEQA Air Quality Guidelines were amended to include a risk and hazards threshold for new receptors and modified procedures for assessing impacts related to risk and hazard impacts. Due to litigation, BAAQMD is no longer recommending that these thresholds be used as a generally applicable measure of a project's significant air quality impacts, but leaves it up to the discretion of the local enforcement agency (LEA) to determine whether these thresholds are appropriate for their use. For this HRA, the BAAQMD significance thresholds were deemed to be appropriate and the thresholds that were used for this project are shown below:

- Non-compliance with a qualified risk reduction plan
- Excess cancer risk of more than 10 in a million
- Non-cancer hazard index (chronic or acute) greater than 1.0
- Incremental increase in average annual $PM_{2.5}$ concentration of greater than 0.3 $\mu g/m^3$

In addition, there are thresholds of significance for cumulative impacts defined as the aggregate total of all past, present, and foreseeable future sources within a 1,000-foot radius of a source or receptor, plus the contribution from the project, exceeds the following:

- Non-compliance with a qualified risk reduction plan
- Excess cancer risk of more than 100 in a million
- Non-cancer hazard index (chronic or acute) greater than 10
- Average annual $PM_{2.5}$ concentration of greater than 0.8 $\mu g/m^3$

Since both the City of Cupertino and Santa Clara County do not currently have qualified risk reduction plans, a site-specific analysis of DPM, TOGs, and $PM_{2.5}$ impacts on sensitive receptors was conducted.

The methodology used in this HRA is consistent with the following BAAQMD and the Office of Environmental Health Hazard Assessment (OEHHA) guidance documents:

3. Methodology and Significance Thresholds

- BAAQMD, 2012. *California Environmental Quality Act Air Quality Guidelines*. May 2012.
- BAAQMD, 2010. *Screening Tables for Air Toxics Evaluation During Construction.* May 2010.
- BAAQMD, 2012. *Recommended Methods for Screening and Modeling Local Risks and Hazards*. Version 3.0. May 2012.
- OEHHA. 2015. *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments.* February, 2015.

Potential exposures to DPM and $PM_{2.5}$ from proposed project construction were evaluated for off-site sensitive receptors in close proximity to the site, which includes the multi-family residences west of the project site. Potential exposures to DPM, TOGs, and $PM_{2.5}$ from operational activities were evaluated for on-site sensitive receptors of the project. Using air dispersion models, receptor concentrations were estimated and excess lifetime cancer risks and chronic and acute non-cancer hazard indexes were calculated. These risks were then compared to the significance thresholds adopted for this HRA.

4. Emissions Inventories

4.1 CONSTRUCTION EMISSIONS

Construction emissions were calculated as average daily emissions in pounds per day, using the proposed construction schedule and the latest version of California Emissions Estimation Model, known as CalEEMod Version 2013.2.2 (CAPCOA, 2013). DPM emissions were based on the CalEEMod construction runs, using annual exhaust PM_{10} construction emissions presented in lbs/day. The $PM_{2.5}$ emissions were taken from the CalEEMod output for $PM_{2.5}$ total, which includes exhaust $PM_{2.5}$ as well as fugitive dust $PM_{2.5}$.

The project was assumed to take place over 38.5 months (1,174 calendar days or 838 work days) from the middle of July 2017 through the end of September 2020. The average daily emission rates from construction equipment used during the proposed project were determined by dividing the annual average emissions for each construction year by the number of construction days per year for each calendar year of construction (i.e., 2017. 2018, 2019, and 2020). The modeled average daily emission rates for the construction scenario are summarized in Table 1. The CalEEMod construction emissions output and emission rate calculations are provided in Appendix A.

Table 1 Construction Activity – Average Daily Emission Rates

Parameter – Year	Onsite Emissions (lbs/day)	Total Offsite Emissions (lbs/day)
DPM – 2017	3.81	0.67
$PM_{2.5}$ - 2017	4.58	2.08
DPM – 2018	1.94	0.45
$PM_{2.5}$ - 2018	1.82	4.05
DPM – 2019	1.22	0.29
$PM_{2.5}$ - 2019	1.15	2.76
DPM – 2020	1.15	0.27
$PM_{2.5}$ - 2020	1.09	2.79

Presented emission rates are average daily emissions.
Source: CalEEMod 2013.2.2.

4.2 OFF-SITE EMISSION SOURCES

Mobile sources within a 1,000-foot radius of the project site were identified using BAAQMD's Highway Screening Analysis Tools (BAAQMD, 2011) and the Draft Transportation Impact Analysis (TIA) prepared for the project (Fehr and Peers, 2015). One highway (I-280) and two high volume roadways, which are defined as having annual average daily trips (AADT) exceeding 10,000 vehicles per day, were identified (Wolfe Road and Pruneridge Avenue). The screening health risk values for each mobile source considered in the assessment are summarized in Table 2.

Table 2 Mobile Source Screening Health Risk Values

Source	Annual Average Daily Trips (AADT)	Cancer Risk (per million)	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ ($\mu g/m^3$)
Interstate 280 [1]	162,000	29.2	0.030	0.026	0.25
Wolfe Road [2]	55,988	30.9	0.030	0.030	0.73
Pruneridge Avenue [2]	12,624	6.16	0.030	0.030	0.16
BAAQMD Significance Threshold		10	1.0	1.0	0.3
Exceeds Threshold?		Yes	No	No	Yes

Sources:
1 Highway traffic from CalTrans (2015) and highway risk values from BAAQMD Highway Screening Analysis Tool (2011).
2 Surface street traffic from Draft TIA for the Hamptons Apartment Complex (Fehr and Peers, 2015), and roadway risk values determined using the BAAQMD Roadway Screening Analysis Calculator (2015).

The screening health risk values for Pruneridge Avenue are below the BAAQMD significance thresholds for individual health risks (10 in a million excess cancer risk or $PM_{2.5}$ concentration greater than 0.3 $\mu g/m^3$), and therefore a more detailed analysis was not required. However, because I-280 and Wolfe Road exceed the threshold for cancer risk, and Wolfe Road exceeds the threshold for $PM_{2.5}$, refined air dispersion modeling was conducted for these mobile sources. Emissions generated from mobile sources depend on the vehicle mix, the rate at which pollutants are generated during the course of travel, and the number of trucks traveling along the roadway network.

To produce a representative vehicle fleet distribution of gasoline fueled and diesel fueled vehicles, the assessment used an estimate of vehicle mix based on annual traffic and truck traffic reports from the California Department of Transportation, Traffic Branch (Caltrans) for I-280 and traffic volumes from the Draft TIA for the project (Fehr and Peers, 2015) for Wolfe Road. Table 3 lists the identified peak hourly traffic volumes and diesel truck percentage considered in the assessment.

Table 3 Vehicle Fleet Mix Profile

Roadway	Peak Hourly Vehicle Traffic (Veh/hr)	Truck Percentage
I-280 (Mile Post 8.375) [1]	12,500	3.16
Wolfe Road (south of Pruneridge Avenue) [2]	5,036	3.51

Sources:
1 Caltrans Traffic Census Website. http://traffic-counts.dot.ca.gov/.
2 Draft TIA for Hamptons Apartment Complex (Fehr and Peers, 2015).

The truck percentage for each evaluated roadway segment was used to estimate the number of diesel trucks traveling on each roadway. To determine hourly traffic volumes, the assessment used data available through the Caltrans Performance Measurement System (Caltrans PeMS, 2015). To account for the emission standards representative of the California fleet, the Air Resources Board has developed the EMFAC2014 emission factor model. EMFAC2014 was used to identify pollutant emission rates for total organic gases (TOG) and diesel particulate matter (DPM), as well as projected traffic increases. To quantify the toxic air contaminants (TACs) associated with the TOG fraction, the speciation profile provided by BAAQMD (2011) was used. Vehicles were assumed to be traveling at 55 mph along Interstate 280 and 35 mph along Wolfe Road.

In addition to mobile sources, stationary sources within a 1,000-foot radius of the project site were identified using BAAQMD's Stationary Source Screening Analysis Tools (BAAQMD, 2012). Only one inactive stationary source was identified, which was associated with the former Apple facility to the east. However, the future Apple Campus 2 will include natural gas boilers, emergency diesel generators, and other equipment that produce TAC emissions. An HRA was prepared for the Apple Campus 2 by LSA Associates, Inc. (2013), which determined the risks to off-site residents from operations at the Apple Campus 2. The health risk values associated with the Apple Campus 2 are summarized in Table 4, and are below the significance thresholds.

Table 4 Stationary Source Health Risk Values

Source	Cancer Risk (per million)	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ ($\mu g/m^3$)
Apple Campus 2	1.15	0.302	n/a	0.171
BAAQMD Significance Threshold	10	1.0	1.0	0.3
Exceeds Threshold?	No	No	No	No

Sources: Apple Campus 2 Project EIR, L. Air Quality (LSA Associates, Inc., 2015).

For the sources that warranted additional characterization (I-280 and Wolfe Road), contaminant release information and associated chemical species were identified based on the speciation profiles provided by BAAQMD. A list of emitted compounds for the mobile-source category is presented in Table 5. Appendix A contains a graphical representation of each emitting source and emission rate calculations for each source considered in the assessment.

5. Dispersion Modeling

To assess the impact of emitted compounds on sensitive receptors near the project, air quality modeling using the ISCST3 atmospheric dispersion model was performed. The model is a steady state Gaussian plume model and is an approved model by BAAQMD for estimating ground level impacts from point and fugitive sources in simple and complex terrain. The on-site construction emissions for the project were modeled as poly-area sources. The off-site mobile sources were modeled as adjacent line volume sources.

The model requires additional input parameters, including chemical emission data and local meteorology. Inputs for the construction and operational phase emission rates are those described in Section 4. Meteorological data obtained from the BAAQMD for the nearest representative met station with the three latest available years of record (Alviso, 1998-2000) were used to represent local weather conditions and prevailing winds. The general prevailing winds at the project are to the southeast. The wind rose for the Alviso meteorological station is provided in Appendix B.

The modeling analysis also considered the spatial distribution and elevation of each emitting source in relation to the sensitive receptors. To accommodate the model's Cartesian grid format, direction-dependent calculations were obtained by identifying the Universal Transverse Mercator (UTM) coordinates for each source location. In addition, digital elevation model (DEM) data for the area were obtained and included in the model runs to account for complex terrain. An emission release height of 4.15 meters was used as representative of the stack exhaust height for off-road construction equipment, and an initial vertical dispersion parameter of 1.93 m was used, per CARB guidance (2000). For mobile sources, two sets of volume sources were created. One set representing the motor vehicles traveling along I-280 and Wolfe Road was used to characterize emissions of TOG and $PM_{2.5}$. For this set of sources, a release height of 0.60 meters was used (CARB, 2000). The second set of sources representing truck traffic was used to characterize emissions of DPM. For this run, a release height of 4.15 m was used.

To determine contaminant impacts during construction hours, the model's Season-Hour-Day (SHRDOW) scalar option was invoked to predict flagpole-level concentrations (1.5 m for ground-floor receptors) for emissions generated between the hours of 7:00 AM and 4:00 PM, with a 1-hour lunch break. In addition, a scalar factor was applied to the risk calculations to account for the number of days residents are exposed to construction emissions per year. For operational impacts, the model's Hour-of-Day (HROFDY) scalar option was invoked to predict concentrations from variable hourly emissions from vehicular traffic.

For all modeling runs, a unit emission rate of 1 gm/sec was used. The unit emission rates were proportioned over the poly-area sources for on-site construction emissions, and divided between the volume sources for off-site highway and roadway emissions. The maximum ISCST3 concentrations from the output files were then multiplied by the emission rates calculated in Appendix A to obtain the maximum flagpole-level concentrations at the maximum exposed receptor (MER). The model output DPM and $PM_{2.5}$ concentrations for the on-site construction sources are provided in Table C1 of Appendix C, and the model output for the

5. Dispersion Modeling

operational emission sources is provided in Table D2 of Appendix D. The ISCST3 model output for the emission sources is presented in Appendix B. For the construction analysis, the configuration of the sources and the receptor locations are presented in Figure 1.

6. Risk Characterizations

6.1 CARCINOGENIC CHEMICAL RISK

A threshold of ten in a million (10E–06) has been established as a level posing no significant risk for exposures to carcinogens.

Health risks associated with exposure to carcinogenic compounds can be defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. The cancer risk probability is determined by multiplying the chemical's annual concentration by its cancer potency factor (CPF), a measure of the carcinogenic potential of a chemical when a dose is received through the inhalation pathway. It is an upper-limit estimate of the probability of contracting cancer as a result of continuous exposure to an ambient concentration of one microgram per cubic meter ($\mu g/m^3$) over a lifetime of 70 years.

Recent guidance from OEHHA recommends a refinement to the standard point estimate approach with the use of age-specific breathing rates and age sensitivity factors (ASFs) to assess risk for susceptible subpopulations such as children. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose for each age group. Once determined, contaminant dose is multiplied by the cancer potency factor in units of inverse dose expressed in milligrams per kilogram per day $(mg/kg/day)^{-1}$ to derive the cancer risk estimate. Therefore, to accommodate the unique exposures associated with the proposed school population, the following dose algorithm was used:

$$\text{Dose}_{\text{AIR,per age group}} = \left(C_{\text{air}} \times \text{EF} \times \left[\frac{\text{BR}}{\text{BW}}\right] \times \text{A} \times \text{CF}\right)$$

Where:

Dose_{AIR}	=	dose by inhalation (mg/kg-day), per age group
C_{air}	=	concentration of contaminant in air ($\mu g/m^3$)
EF	=	exposure frequency (number of days/365 days)
BR/BW	=	daily breathing rate normalized to body weight (L/kg-day)
A	=	inhalation absorption factor (default = 1)
CF	=	conversion factor ($1x10^{-6}$, μg to mg, L to m^3)

The inhalation absorption factor (A) is a unitless factor that is only used if the cancer potency factor included a correction for absorption across the lung. For this assessment, the default value of 1 was used. The exposure frequency (EF) of 0.96 is used to represent 350 days per year to allow for a two week period away from home each year (OEHHA, 2015). The 95th percentile daily breathing rates (BR/BW), exposure duration (ED), age sensitivity factors (ASFs), and fraction of time at home (FAH) for the various age groups are provided herein:

6. Risk Characterizations

Age Groups	BR/BW (L/kg-day)	ED	ASF	FAH
Third trimester	361	0.25	10	0.85
0-2 age group	1,090	2	10	0.85
2-9 age group	861	7	3	0.72
2-16 age group	745	14	3	0.72
16-30 age group	335	14	1	0.73
16-70 age group	290	54	1	0.73

For construction analysis, the exposure duration spans the length of construction (e.g. 1,174 days or 3.2 years). To calculate the overall cancer risk, the risk for each appropriate age group is calculated per the following equation:

$$\text{Cancer Risk}_{\text{AIR}} = \text{Dose}_{\text{AIR}} \times \text{CPF} \times \text{ASF} \times \text{FAH} \times \frac{\text{ED}}{AT}$$

Where:

Dose_{AIR} = dose by inhalation (mg/kg-day), per age group
CPF = cancer potency factor, chemical-specific $(\text{mg/kg-day})^{-1}$
ASF = age sensitivity factor, per age group
FAH = fraction of time at home, per age group
ED = exposure duration (years)
AT = averaging time period over which exposure duration is averaged (always 70 years)

The CPFs used in the assessment were obtained from OEHHA guidance. The excess lifetime cancer risks during the construction period and during the operational phase to the maximally exposed resident were calculated based on the factors provided above. The cancer risks for each age group are summed to estimate the total cancer risk for each toxic chemical species. For purposes of this assessment, the calculated residential cancer risks associated with construction activities are based on the 3rd trimester, 0 to 2 year old, and 2 to 16 year old age groups. The final step converts the cancer risk in scientific notation to a whole number that expresses the cancer risk in "chances per million" by multiplying the cancer risk by a factor of $1x10^6$ (i.e. 1 million).

The assessment was based on reasonable maximum exposure, defined as the "highest exposure that is reasonably expected to occur" for a given receptor population. Lifetime risk values for the adult residents were calculated for an exposure of 350 days per year for 30 years (high-end estimate) in accordance with OEHHA's guidance. Additionally, the maximum lifetime residency exposure (70-year scenario) and the average residency exposure (9-year scenario) risk values were determined for informational purposes. It was assumed that the MER spent 24 hours/day, 7 days/week, 350 days/year outside near the residence, as per default exposure parameters.

CARB's Hotspots Analysis and Reporting Program (HARP), Risk Assessment Standalone Tool was used to calculate the cancer risk values (CARB, 2015). For construction, the calculated results are provided in Appendix C. For the operational phase, the calculated results are provided in Appendix D.

6.2 NON-CARCINOGENIC HAZARDS

An evaluation of the potential non-cancer effects of chronic and acute chemical exposures was also conducted. Adverse health effects are evaluated by comparing the annual receptor level (flagpole) concentration of each chemical compound with the appropriate reference exposure limit (REL). Available RELs promulgated by OEHHA were considered in the assessment.

To quantify non-carcinogenic impacts, the hazard index approach was used. The hazard index assumes that chronic and acute sub-threshold exposures adversely affect a specific organ or organ system (toxicological endpoint). For each discrete chemical exposure, target organs presented in regulatory guidance were used. To calculate the hazard index, each chemical concentration or dose is divided by the appropriate toxicity value. For compounds affecting the same toxicological endpoint, this ratio is summed. Where the total equals or exceeds one, a health hazard is presumed to exist.

For construction, the chronic hazard analysis for DPM is provided in Appendix C. For the operational phase, the chronic and acute hazard analysis is provided in Appendix D. CARB's HARP, Risk Assessment Standalone Tool was used to calculate the chronic and acute health risk values (CARB, 2015).

6.3 CRITERIA POLLUTANTS

The BAAQMD has recently incorporated $PM_{2.5}$ into the District's CEQA significance thresholds due to recent studies that show adverse health impacts from exposure to this pollutant. An incremental increase of greater than 0.3 $\mu g/m^3$ for the annual average $PM_{2.5}$ concentration is considered to be a significant impact. The modeling results for $PM_{2.5}$ are summarized in Tables 5 and 6.

6. Risk Characterizations

This page intentionally left blank.

7. Conclusions

7.1 CONSTRUCTION HEALTH RISKS

The residential health risk values are based on the maximum modeled receptor concentration over the construction exposure period, conservatively assuming a 24-hour per day outdoor exposure and averaged over a 70-year lifetime. According to the modeling results and as shown in Figure 1, the MER is the northeastern-most residential building of the Arioso Apartment complex to the west of the project site. Results of the health risk assessment shown in Table 6 indicate that the maximum incremental cancer risk during the construction phase of the project at the MER is 11.5 per million (11.5E-05), which is above the significance threshold of 10 per million.

For non-carcinogenic effects, the hazard index identified for each toxicological endpoint totaled less than one for the MER. Therefore, chronic non-carcinogenic hazards are within acceptable limits. Lastly, the highest $PM_{2.5}$ annual concentration at the MER is 0.09 $\mu g/m^3$ and would not exceed the BAAQMD significance threshold of 0.3 $\mu g/m^3$.

Table 6 Construction HRA Results

Receptor	Cancer Risk (per million)	Chronic Hazard Index	$PM_{2.5}$ ($\mu g/m^3$)[1]
Resident (Maximum Exposed Receptor)	11.5	0.033	0.09
BAAQMD Threshold	10	1.0	0.3
Exceeds Threshold	Yes	No	No

Sources: Lakes AERMOD View, 9.1, 2015.
[1] From year 2017 which represents the highest maximum annual $PM_{2.5}$ concentration.

As the calculated cancer risk at the MER exceeds the 10 per million significance threshold, the following mitigation measure is recommended to minimize risk impacts:

MIT During construction, the construction contractor shall use construction equipment fitted with engines that meet the United States Environmental Protection Agency (EPA)-Certified Tier 3 emissions standards for equipment of 50 horsepower or more. The construction contractor shall maintain a list of all operating equipment in use on the project site for verification by the City of Cupertino Building Division official or their designee. The construction equipment list shall state the makes, models, and number of construction equipment onsite. Equipment shall properly service and maintain construction equipment in accordance with the manufacturer's recommendations. The construction contractor shall also ensure that all nonessential idling of construction equipment is restricted to five minutes or less in compliance with CARB Rule 2449. Prior to issuance of any construction

7. Conclusions

permit, the construction contractor shall ensure that all construction plans submitted to the City of Cupertino Planning Department and/or Building Division clearly show the requirement for EPA Tier 3 or higher emissions standards for construction equipment over 50 horsepower.

Tables 7 and 8 show the average daily emission rates and calculated cancer risk at the MER, respectively, with incorporation of the mitigation measure.

Table 7 Construction Activity – Average Daily Emission Rates With Mitigation

Parameter – Year	Onsite Emissions (lbs/day)[1]	Total Offsite Emissions (lbs/day)[1]
DPM – 2017	1.60	0.67
$PM_{2.5}$ - 2017	2.65	2.08
DPM – 2018	1.24	0.45
$PM_{2.5}$ - 2018	1.24	4.05
DPM – 2019	0.87	0.29
$PM_{2.5}$ - 2019	0.87	2.76
DPM – 2020	0.94	0.27
$PM_{2.5}$ - 2020	0.94	2.79

Presented emission rates are average daily emissions.
Source: CalEEMod 2013.2.2.
[1] Accounts for emissions reductions from implementation of mitigation which requires use of Tier 3 rated engines for construction equipment with a horsepower rating of 50 horsepower or higher.

Table 8 Construction HRA Results – With Mitigation

Receptor	Cancer Risk (per million)	Chronic Hazard Index	$PM_{2.5}$ ($\mu g/m^3$)[1]
Resident (Maximum Exposed Receptor)	6.9	0.019	0.05
BAAQMD Threshold	10	1.0	0.3
Exceeds Threshold	No	No	No

Sources: Lakes AERMOD View, 9.1, 2015.
[1] From year 2017 which represents the highest maximum annual $PM_{2.5}$ concentration.

As shown in Table 8, incorporation of mitigation would reduce cancer risk at the MER to 6.9 per million (6.9E-06), which is below the 10 per million significance threshold. The results of this construction health risk assessment indicate that the project would have a less than significant impact with respect to chronic non-carcinogenic hazard and $PM_{2.5}$ impacts for the surrounding sensitive receptors during the 38.5-month construction period. Additionally, with incorporation of mitigation, excess cancer risk would also be less than significant to the nearby sensitive receptors. It should also be noted that conservative assumptions were used in preparing the health risk assessment. For example, residential receptors are assumed to spend 24 hours per

day outdoors and exposed to construction emissions whereas California residents typically will spend a maximum of just over one hour per day outdoors at their residences (CARB, 1991), which would result in much lower estimated risk values.

7.2 OPERATIONAL HEALTH RISKS

For the operational HRA, the refined modeling results from individual and cumulative emission sources, provided in Table 9, indicate that the excess cancer risk from each individual mobile and stationary source within 1,000 feet of the site is less than the threshold of 10 in a million for a lifetime cancer risk and less than the non-carcinogenic chronic and acute hazard indexes of 1.0. The $PM_{2.5}$ concentrations for all individual emission sources are below the significance threshold of 0.3 μg/m³. In addition, the cumulative health risks from all evaluated emission sources are below the cumulative significance thresholds.

Table 9 Operational HRA Results

Receptor	Cancer Risk (per million)	Chronic Hazard Index	Acute Hazard Index	$PM_{2.5}$ (μg/m³)
REFINED MODELING VALUES [1]				
Interstate 280	1.89 ([2])	0.002	0.005	0.11
Wolfe Road	3.98 ([2])	0.004	0.006	0.11
SCREENING VALUES [3]				
Pruneridge Avenue	6.16	0.030	0.030	0.16
Apple Campus 2	1.15	0.302	0.302	0.17
BAAQMD Threshold	10	1.0	1.0	0.3
Exceeds Threshold	No	No	No	No
Total Health Risk Values – All Sources	13.2	0.34	0.34	0.54
BAAQMD Threshold	100	10.0	10.0	0.8
Exceeds Threshold	No	No	No	No

Sources:
1 Lakes AERMOD View, 9.1, 2015.
2 Residential cancer risks for Interstate 280 and Wolfe Road were determined using the high-end residency exposure duration of 30-years (OEHHA, 2015). For informational purposes, the maximum 70-year lifetime and 9-year average residency time cancer risks were calculated and were also below BAAQMD's significance thresholds. These values are provided in Appendix D.
3 BAAQMD Roadway Screening Analysis Calculator (2015); Apple Campus 2 Project EIR, L. Air Quality (LSA Associates, Inc., 2013).

Based on a comparison to the carcinogenic and non-carcinogenic thresholds established by OEHHA and BAAQMD, hazardous air emissions generated from the stationary and mobile sources within a 1,000-foot radius are not anticipated to pose an actual or potential endangerment to residents of the project site and no mitigation measures are required.

Source: Bay Area Air Quality Management District (BAAQMD). 2010, May. Screening Tables for Air Toxics Evaluation During Construction, Version 1.0.

Notes:

1. The BAAQMD thresholds are an increased cancer risk of 10 in a million, a hazard index of 1, and a PM2.5 annual average concentration of 0.3 µg/m3.

2. The OEHHA proposes weighting cancer risk by a factor of 10 for exposures that occur from the third trimester of pregnanacy to 2 years of age, and by a factor of 3 for exposures that occur from 2 years through 15 years of age. These factors are call Age Sensitivity Factors (ASF). The methodology for applying ASF to cancer risk is discussed in BAAQMD's CEQA Construction Screening Approach.

3. Acrolein was chosen because it has the greatest non-cancer health risks for toxic air contaminants contained in diesel exhaust.

Bay Area Air Quality Management District

Roadway Screening Analysis Calculator

County specific tables containing estimates of risk and hazard impacts from roadways in the Bay Area.

INSTRUCTIONS:

Input the site-specific characteristics of your project by using the drop down menu in the "Search Parameter" box. We recommend that this analysis be used for roadways with 10,000 AADT and above.

• County: Select the County where the project is located. The calculator is only applicable for projects within the nine Bay Area counties.

• Roadway Direction: Select the orientation that best matches the roadway. If the roadway orientation is neither clearly north-south nor east-west, use the highest values predicted from either orientation.

• Side of the Roadway: Identify on which side of the roadway the project is located.

• Distance from Roadway: Enter the distance in feet from the nearest edge of the roadway to the project site. The calculator estimates values for distances greater than 10 feet and less than 1000 feet. For distances greater than 1000 feet, the user can choose to extrapolate values using a distribution curve or apply 1000 feet values for greater distances.

• Annual Average Daily Traffic (ADT): Enter the annual average daily traffic on the roadway. These data may be collected from the city or the county (if the area is unincorporated).

When the user has completed the data entries, the screening level PM2.5 annual average concentration and the cancer risk results will appear in the Results Box on the right. Please note that the roadway tool is not applicable for California State Highways and the District refers the user to the Highway Screening Analysis Tool at: http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx.

Notes and References listed below the Search Boxes

Search Parameters

County	Santa Clara
Roadway Direction	North-South
Side of the Roadway	East
Distance from Roadway	35 feet
Annual Average Daily Traffic (ADT)	55,988

Results

Santa Clara County

NORTH-SOUTH DIRECTIONAL ROADWAY

PM2.5 annual average

0.728 ($\mu g/m^3$)

Cancer Risk

30.92 (per million)

Data for Santa Clara County based on meteorological data collected from San Jose Airport in 1997

Notes and References:

1. Emissions were developed using EMFAC2011 for fleet mix in 2014 assuming 10,000 AADT and includes impacts from diesel and gasoline vehicle exhaust, brake and tire wear, and resuspended dust.
2. Roadways were modeled using CALINE4 air dispersion model assuming a source length of one kilometer. Meteorological data used to estimate the screening values are noted at the bottom of the "Results" box.
3. Cancer risks were estimated for 70 year lifetime exposure starting in 2014 that includes sensitivity values for early life exposures and OEHHA toxicity values adopted in 2013.

Bay Area Air Quality Management District

Risk & Hazard Stationary Source Inquiry Form

This form is required when users request stationary source data from BAAQMD. This form is to be used with the BAAQMD's Google Earth stationary source screening tables.

For guidance on conducting a risk & hazard screening, including for roadways & freeways, refer to the District's Risk & Hazard Analysis flow chart. Also see the District's Recommended Methods for Screening and Modeling Lo

Table A: Requestor Contact Information	
Contact Name:	Steve Bush
Affiliation:	PlaceWorks
Phone:	510-848-3815, ext. 316
Email:	sbush@placeworks.com
Date of Request	12/17/2015
Project Name:	Residential Development
Address:	19500 Pruneridge Ave
City:	Cupertino
County:	Santa Clara
Type (residential, commercial, mixed use, industrial, etc.):	Residential Development
Project size (# of units, or building square feet):	12.4 acres, 942 dwelling units
Comments:	
Please provide emission rate and generator testing information, or risk values for any additionally identified sources. See attached map.	

For Air District assistance, the following steps must be completed:

1. Complete all the contact and project information requested in Table A. Incomplete forms will not be processed. Please include a project site map.
2. Download and install the free program Google Earth, http://www.google.com/earth/download/ge/, and then download the county specific Google Earth stationary source application files from the District's website, http://www.baaqmd.gov/Divisions/Planning-and-Research/CEQA-GUIDELINES/Tools-and-Methodology.aspx. The small points on the map represent stationary sources permitted by the District (Map A on right). These permitted sources include diesel back-up generators, gas stations, dry cleaners, boilers, printers, auto spray booths, etc. Click on a point to view the source's Information Table, including the name, location, and preliminary estimated cancer risk, hazard index, and PM2.5 concentration.
3. Find the project site in Google Earth by inputting the site's address in the Google Earth search box.
4. Identify stationary sources near the project. Verify that the location of the source on the map matches with the source's address in the Information Table, by using the Google Earth address search box to confirm the source's address location. Please report any mapping errors to the District.
5. List the stationary source information in Table B Section 1 below.
6. Note that a small percentage of the stationary sources have Health Risk Screening Assessment (HRSA) data INSTEAD of screening level data. These sources will be noted by an asterisk next to the Plant Name (Map B on right). If HRSA values are presented, these values have already been modeled and cannot be adjusted further.
7. Email this completed form to District staff. District staff will provide the most recent risk, hazard, and PM2.5 data that are available for the source(s). If this information or data are not available, source emissions data will be provided. Staff will respond to inquiries within three weeks.

Note that a public records request received for the same stationary source information will cancel the processing of your SSIF request.

Submit forms, maps, and questions to Alison Kirk at 415-749-5169, or akirk@baaqmd.gov .

Emission Rate (gr/sec) = ((Emission Factor x Volume/Baseline)/(1609.3 m/mile) x (3600 sec/hr)) x (Link Length)

1 **I-280**
Mile Post 8.375

Link Length (meters)	713
Peak Hour Volume/Baseline (VPH) - 2020	13,572
PM2.5 Vehicular Emission Factor (gr/mi) - 2020	0.0032
Peak Hour Pollutant Reentrainment Emission Rate (gr/sec)	1.96E-02
Peak Hour Pollutant Emission Rate (gr/sec)	5.34E-03
Peak Hour Pollutant Emission Rate Total (gr/sec)	**2.49E-02**

2 **Wolfe Rd**
Intersection: Pruneridge Ave

Link Length (meters)	857
Peak Hour Volume/Baseline (VPH) - 2020	5,393
PM2.5 Vehicular Emission Factor (gr/mi) - 2020	0.0032
Peak Hour Pollutant Reentrainment Emission Rate (gr/sec)	4.26E-03
Peak Hour Pollutant Emission Rate (gr/sec)	2.55E-03
Peak Hour Pollutant Emission Rate Total (gr/sec)	**6.82E-03**

Initial Sigma Computation

Vertical Sigma Calculations - At-Grade or Above Grade Roadway

Initial Horizontal Dispersion Parameter (Sigma Y)
SY = (source separation distance)/2.15

Initial Vertical Dispersion Parameter (Sigma Z)
$SZ = (1.8 + 0.11(TR)) \times (60/30)^{0.2}$
TR = W2/U

Where:
W2 = traveled way half width (m)
U = average wind speed (m/s)

1 **I-280**
Mile Post 8.375

Width of Traveled Way (m)	41
Average Wind Speed (m/s)	3.00
Source Separation Distance (m)	41

SY = **19.1**
SZ = **2.93**

2 **Wolfe Rd**
Intersection: Pruneridge Ave

Width of Traveled Way (m)	25
Average Wind Speed (m/s)	3.00
Source Separation Distance (m)	25

SY = **11.6**
SZ = **2.59**

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  --  SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses URBAN Dispersion.

**Model Uses Regulatory DEFAULT Options:
           1. Final Plume Rise.
           2. Stack-tip Downwash.
           3. Buoyancy-induced Dispersion.
           4. Use Calms Processing Routine.
           5. Not Use Missing Data Processing Routine.
           6. Default Wind Profile Exponents.
           7. Default Vertical Potential Temperature Gradients.
           8. "Upper Bound" Values for Supersquat Buildings.
           9. No Exponential Decay for URBAN/Non-SO2

**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates ANNUAL Averages Only

**This Run Includes:    20 Source(s);      3 Source Group(s); and      64 Receptor(s)

**The Model Assumes A Pollutant Type of:  OTHER

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                m for Missing Hours
                                                                b for Both Calm and Missing Hours
```

**Intermediate Terrain Processing is Selected

**Model Is Setup For Calculation of Average CONCentration Values.

  --  SCAVENGING/DEPOSITION LOGIC --
**Model Uses NO DRY DEPLETION.  DDPLETE =  F
**Model Uses NO WET DEPLETION.  WDPLETE =  F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses URBAN Dispersion.

**Model Uses Regulatory DEFAULT Options:
           1. Final Plume Rise.
           2. Stack-tip Downwash.
           3. Buoyancy-induced Dispersion.
           4. Use Calms Processing Routine.
           5. Not Use Missing Data Processing Routine.
           6. Default Wind Profile Exponents.
           7. Default Vertical Potential Temperature Gradients.
           8. "Upper Bound" Values for Supersquat Buildings.
           9. No Exponential Decay for URBAN/Non-SO2

**Model Accepts Receptors on ELEV Terrain.

**Model Accepts FLAGPOLE Receptor Heights.

**Model Calculates  1 Short Term Average(s) of:   1-HR
    and Calculates PERIOD Averages

**This Run Includes:   102 Source(s);      4 Source Group(s); and     107 Receptor(s)

**The Model Assumes A Pollutant Type of:  OTHER

**Model Set To Continue RUNning After the Setup Testing.

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
```

Model Input - On-site HRA
Unit Emission Rates (1 g/s)

```
                                                    m for Missing Hours
                                                    b for Both Calm and Missing Hours

**Misc. Inputs:  Anem. Hgt. (m) =    10.00 ;    Decay Coef. =    0.000     ;    Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                 ;  Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =     1.3 MB of RAM.

**Input Runstream File:          HamptonsOp.INP
**Output Print File:             HamptonsOp.OUT
**Detailed Error/Message File:   HAMPTO~1.ERR
